

FLORIAN
LENZ

Terraform like a Pro

From ClickOps to Code and Pipelines with
Cost, Security, and Compliance Built In

Hello!

Florian Lenz

Azure Solutions Architect

**Hey Florian, I have an idea for an API,
and I need API management for it. It's
super simple, no big deal.**

John Doe

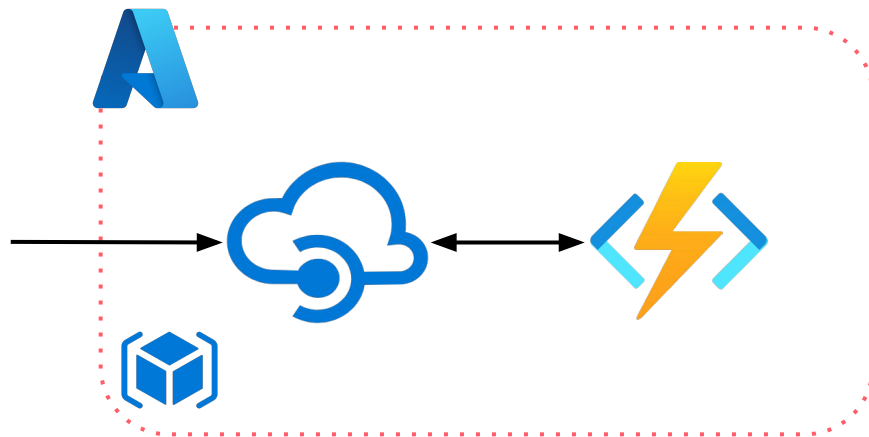

CEO

Resource Creation

01 Resource Group

02 API Management

03 Azure Functions

Ah, and I forgot: we have a test environment. Could you therefore create a new stage as well?

03 Azure Functions

A third environment is necessary. And can we use the API Management User Portal and security? We should update the policies for security reasons. ...

Step 1 – From ClickOps to Code

Stop clicking, start defining infrastructure as code with Terraform.

Terraform

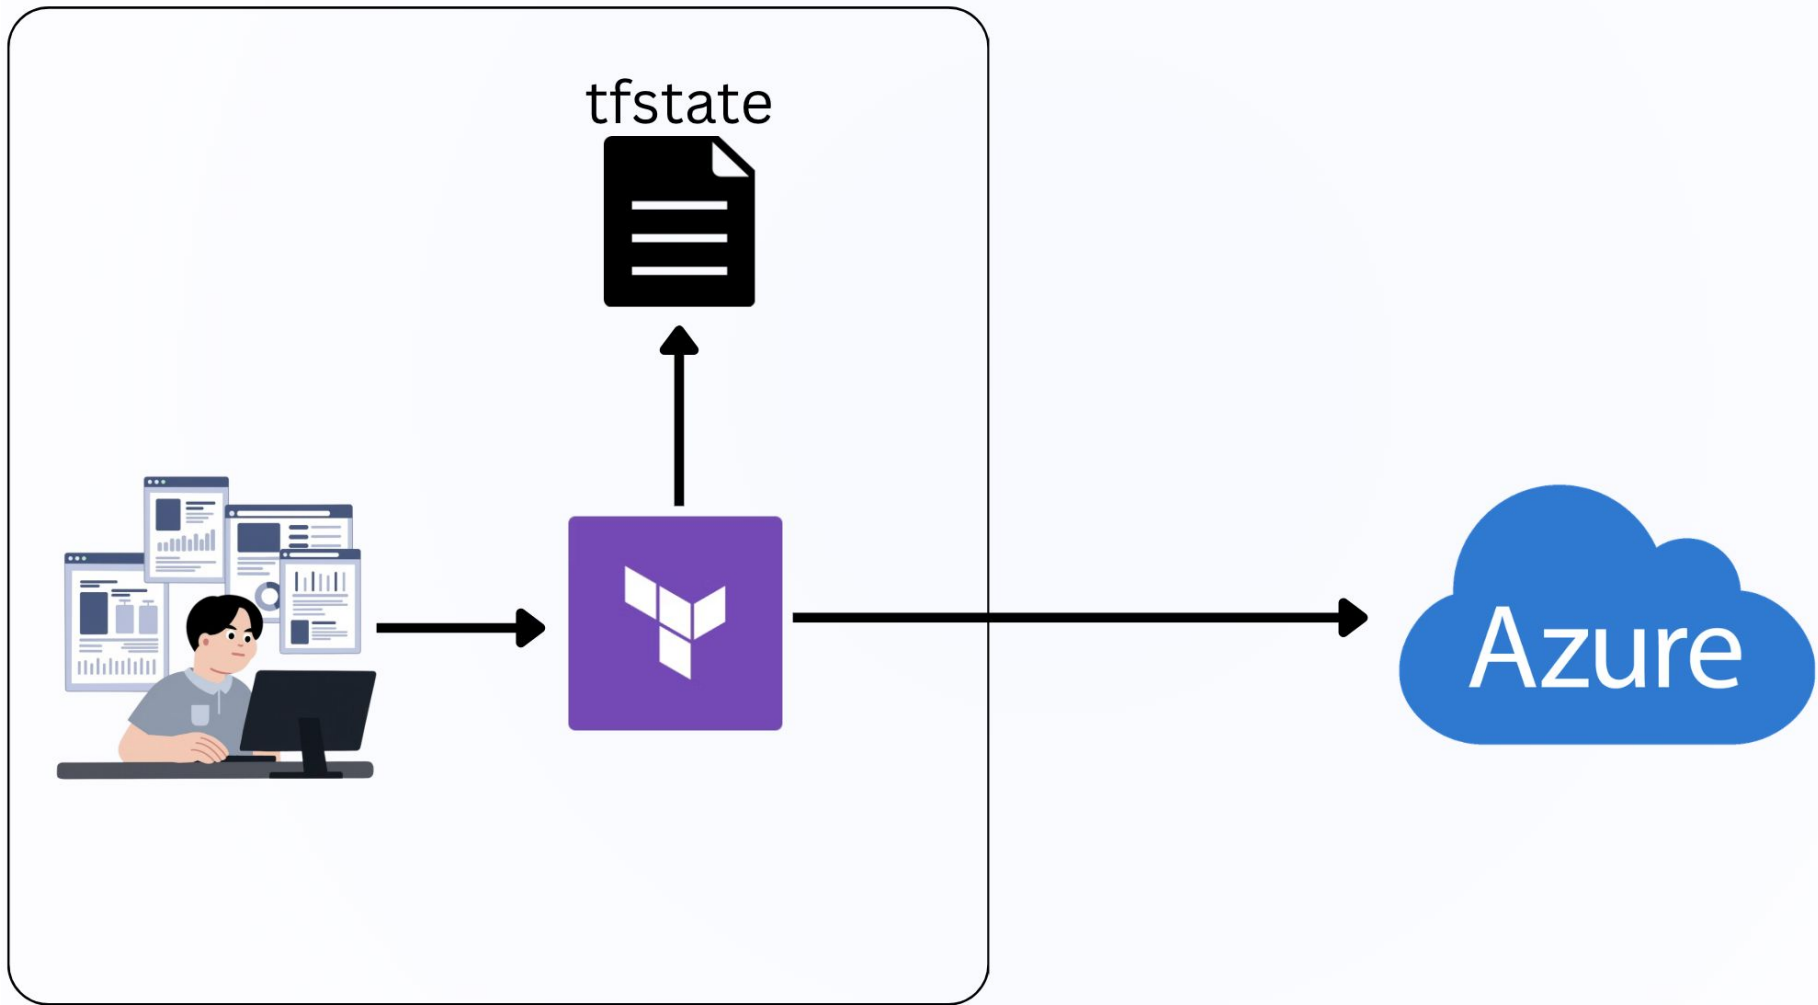

Define your infrastructure declaratively as code instead of manual configuration.

Local Backend

Store state locally for a simple, quick start without external dependencies.

Single User

One developer manages deployments, keeping the setup lightweight but limited.

Step 2 – Version Everything

Use GitHub repositories and a remote backend to create an auditable, collaborative source of truth.

GitHub Repository

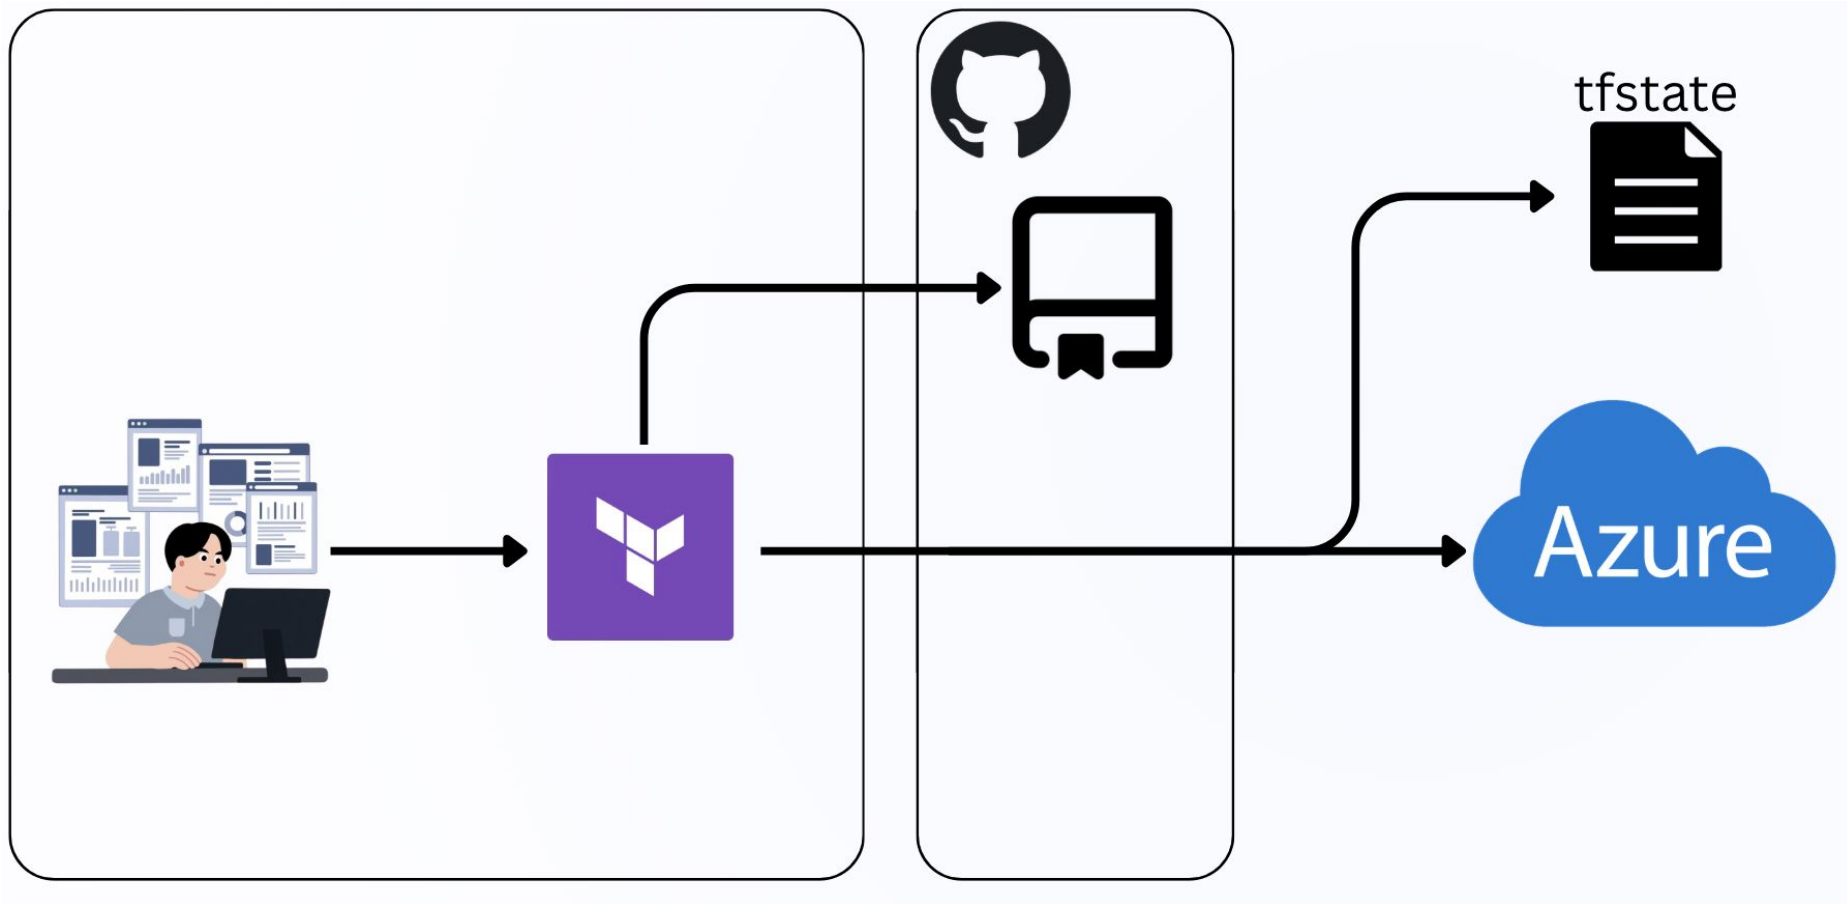

Centralize your infrastructure code for collaboration and version control.

Audit Trail

Track every change through commits and pull requests for full transparency.

Remote Backend

Store state remotely to enable team access and safe, consistent deployments.

Step 3 – Automate Deployments

Leverage GitHub Actions to automatically deploy infrastructure across environments in a consistent and repeatable way.

GitHub Actions

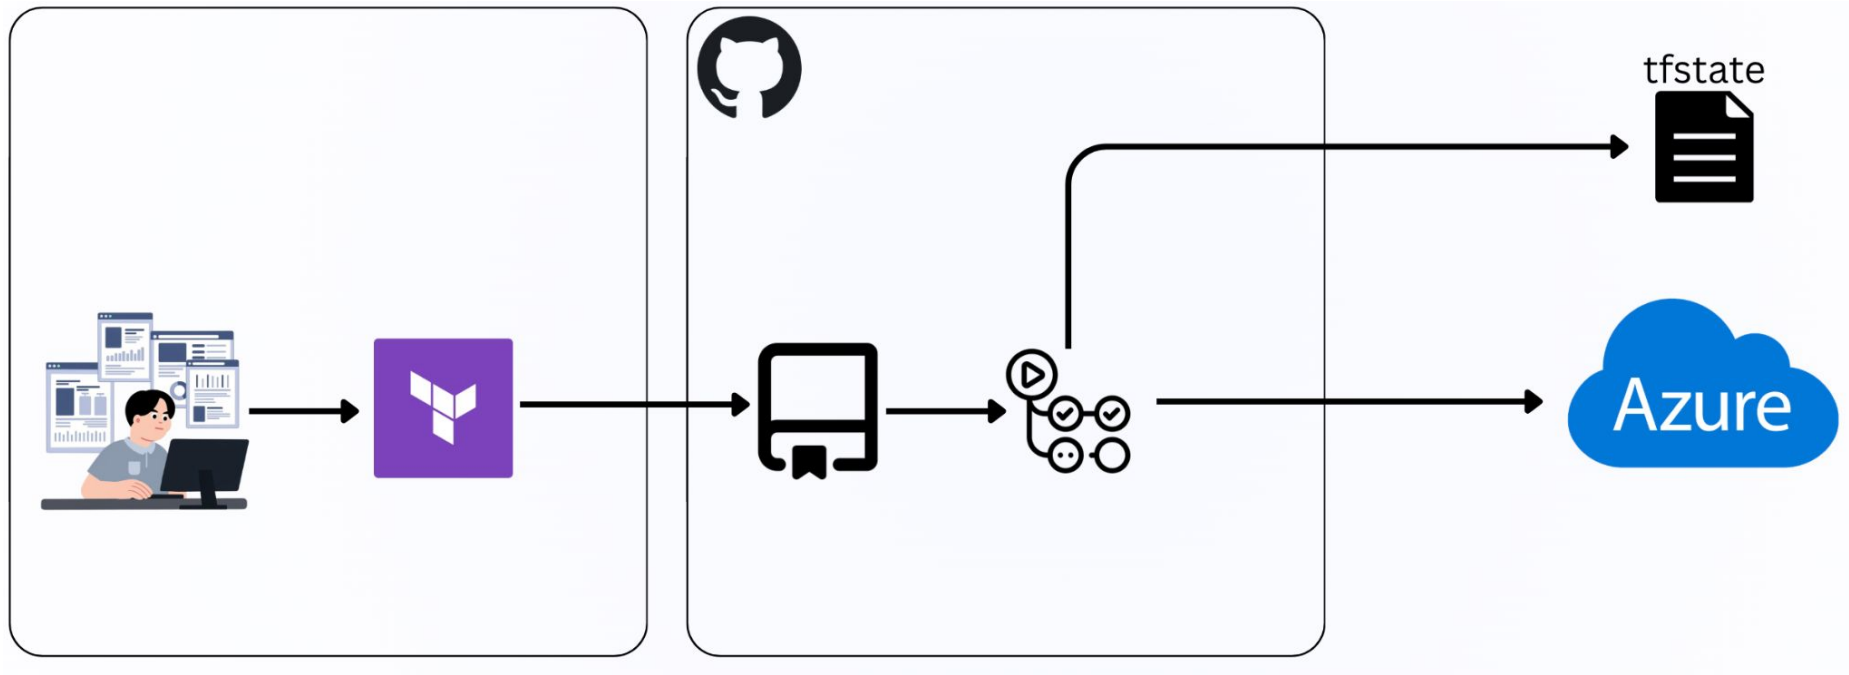

Automate infrastructure deployments through CI/CD pipelines.

Branching Strategy

Define clear branching and release workflows to control how changes move across environments.

Secret Management

Securely handle credentials and sensitive data within your pipeline.

Step 4 – Build Guardrails Early

Integrate cost, security, and policy checks like Infracost, Checkov, and OPA directly into your pipeline before deployment.

OPA Policy

Enforce policies and compliance rules before infrastructure is deployed.

Checkov

Scan your infrastructure code for security and misconfiguration issues early.

Infracost

Estimate and review infrastructure costs directly in your workflow.
